2018 DataHaven Community Wellbeing Survey
# Danbury Crosstabs

Results Overview

These crosstabs contain data collected through the 2018 DataHaven Community Wellbeing Survey's live, in-depth interviews with 16,043 individuals statewide, including 414 in Danbury. The survey assessed topics such as health, employment, and neighborhood resources. Respondents spanned a broad range of ages, ethnicities, and socioeconomic statuses from every Connecticut zip code, and all results are based on weighting survey data to be representative of the entire adult population (see methodology). Data collected at this level reveal local trends in quality of life, including these examples:

Local government can improve by continuing to listen to constituents: Eighty-five percent of adults are satisfied with the area in which they live, with the majority citing recreational facilities, safety, and employment opportunities as perks of their communities. People were more ambivalent about local government: Roughly half reported that their local government's responsiveness was good or excellent. But 68 percent felt they were able to influence government decision-making at least a little, and this was an eight-percentage-point increase from the last iteration of the DataHaven survey in 2015, suggesting that trust in local civic engagement is on the rise.

Growing shares of adults feel heard by local government

Percent of Danbury adults reporting having at least some influence over local government by income, 2015-2018

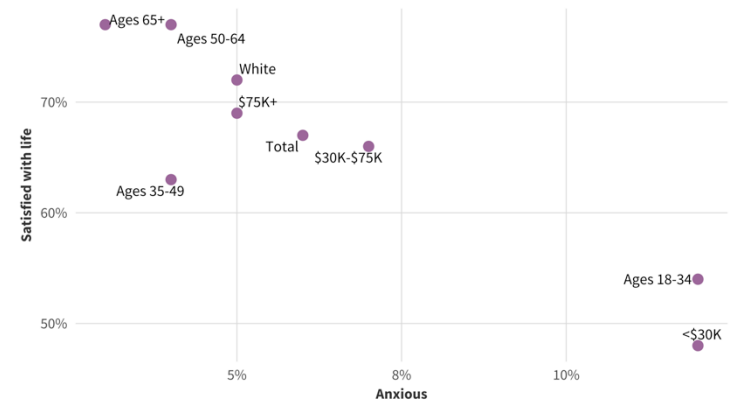

Young adults and non-white adults are within walking distance of more amenities: In Danbury, 46% of adults are within walking distance of amenities like stores and banks. This is slightly lower than the statewide figure (54%). But, certain demographics find themselves more conveniently situated. Fifty-four percent of Danbury adults between 18-34 and 56% of non-white Danbury adults are in walking distance of amenities. These demographic groups also find that it is safe to walk on the sidewalks/crosswalks in their neighborhoods (53% of Danbury adults between 18-34 and 51% of non-white Danbury adults, compared to 43% of Danbury adults overall.)

Life satisfaction is high, but not for everyone: Sixty-seven percent of adults reported feeling at least mostly satisfied with their life, but satisfaction is substantially lower in some demographic groups. Fifty-four percent of young adults (18-34) are at least mostly satisfied with their lives, and only 48% of adults making less than $30,000 say the same. These groups also report higher anxiety – about one in four young adults and a similar share of all adults making less than $30,000 report feeling mostly/completely anxious.

Less anxious groups of adults are more satisfied with life
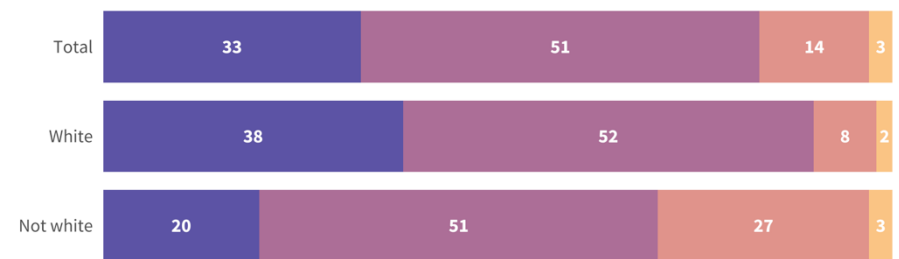

Percent of Danbury adults mostly/completely satisfied with life vs percent of adults mostly/completely anxious by age, race, and income, 2018

Experiences with the police vary by race: Non-white adults in Danbury are much less favorable about the police than white adults. Only 71% of non-white adults said the local police are doing a good or excellent job, compared to 90% of white adults. This disparity also exists between income brackets: 86% of adults making more than $75,000 said the local police are doing a good or excellent job, compared to 81% of adults making less than $30,000.

Non-white adults view local police less favorably

Responses to job done by local police by race; percent of Danbury adults, 2018

How To Read This Document

The data in these crosstabs represent question-by-question weighted estimates, disaggregated by various demographic and socioeconomic characteristics. Each estimate represents how a group of respondents—weighted to be representative of the population within the specified geographic area—answered the question shown.

Please use caution in interpreting the information here, and consider the limitations of the populations from which the data was collected. In particular, please be aware of "skip patterns" in the survey, such as "*Q23E1. (If still have asthma) During the past 30 days, how often have you used a prescription asthma inhaler during an asthma attack to stop it*?" Only the subset of adults who indicated in the previous two questions that they had been diagnosed with asthma and still have it would have been eligible to receive this question. Therefore, the estimates show the percentages of adults with "current asthma" who have used inhalers, not the percentages of all adults who have used them.

The number of respondents to any given question is represented by "Weighted Total." For example, many questions were answered by all 414 Danbury respondents, so in the Danbury column you will see a Weighted Total of 414. But the columns for each smaller population group (e.g., adults age 18-34) or the columns for questions that were asked only to a subset of adults will have smaller weighted totals. Generally, columns with demographic breakdowns are only included when the number of respondents completing that item was at least 50. Additionally, some questions were asked to special groupings of respondents or "ballots." Respondents were randomly-assigned to one of three statewide ballots (split 45%, 45%, and 10%) at the outset of the survey. For these questions (e.g., question LIFECA, asked to 45% of adults, giving a Weighted Total of 178 people), weighted totals are generally smaller than they are for the questions that were asked to 100% of eligible respondents.

We recommend contacting DataHaven with any questions. DataHaven is happy to help you confirm whether the information in this document is being interpreted in a correct way, and possibly to recommend further analysis that might be useful to your work.

Methodology

The DataHaven Community Wellbeing Survey was designed by DataHaven in consultation with over 100 local, statewide, and national survey research experts and local partners, in many cases drawing upon questions commonly used in other surveys.

On behalf of DataHaven, the Siena College Research Institute (SRI) conducted the survey of 16,043 residents of the state of Connecticut, including 414 in Danbury (additional surveys were also completed in parts of New York State, but are not included in these estimates). Surveys were conducted from March 6 through November 29, 2018. Residents age 18 and older were interviewed from all 169 towns in Connecticut. Interviews were conducted in English and Spanish. The overall Connecticut sample of 16,043 and the Danbury sample of 414 were weighted by age, gender, reported race, and geography to ensure that they were statistically representative of the area's demographics. In addition to demographic parameters, the samples were also weighted

to match current patterns of telephone status (landline only, cell phone only or both), based on the state-level estimates from the National Health Interview Survey.

Respondents were contacted via landline or cell phone. To ensure the selection of both listed and unlisted telephone numbers, the design of the sample incorporated random digit dialing (RDD). The cell phone sample was drawn from a sample of dedicated wireless telephone exchanges from within Connecticut. Approximately 1/3 of residents completed the survey on a cell phone. In addition to the traditional RDD samples for landline and cell, we augmented the sample using a stratified sampling technique. These stratified samples maintained RDD for both landline and cell but used information from the U.S. Census so as to enhance the composition of the sample, including targeted regions, urban centers, and high concentrations of minority populations. The primary supplier of the RDD landline and cell phone samples was Survey Sampling International (SSI) of Shelton, Connecticut. Additionally, for the cell phone sample we utilized SSI's Wireless LITe database which uses billing address to enable the targeting of cell phone sample by region or zip code. This database also permitted the inclusion of non-Connecticut telephone numbers as someone may have moved and their billing address is in the area but their cell phone number is not a 'typical' Connecticut telephone number (i.e., not a 203, 860 area code). All of these respondents were screened by live interviewers to confirm their residence in a qualifying town and zip code before interviews continued.

Reported Margins of Error

Margins of error are shown at the top of the crosstab. The "maximum" margin of error for the Danbury sample of 414 adults is +/- 5.8% with a 95% confidence interval, including the design effects resulting from weighting. This means that in 95 out of every 100 samples of the same size and type, the results that we obtain would never vary by more than plus or minus 5.8 percentage points from the result that we would get if we could interview every single member of the adult population of Danbury. This maximum margin of error applies when an observed percentage is 50%, and the margin of error becomes smaller as the percentage approaches the extremes of 0% or 100%. Margins of error are higher for small geographic or population groups. The statewide MOE is 1.0%.

Contact Us

As a non-profit organization with a 25-year history of public service to Connecticut, DataHaven has a mission to help drive community action that improves quality of life. One way of doing so is by ensuring that data from this survey, as well as from other public data sources, are useful and accessible to the public. Contact us via email at info@ctdatahaven.org or via our website (http://ctdatahaven.org/contact). Extensive additional survey results are posted on our website.

I have a few questions about prescription painkillers. When we ask about prescription painkillers, we mean strong ones, sometimes called opioids, such as Percocet, OxyContin or Vicodin. Let me remind you that this is a completely confidential interview. Do you personally know anyone who has struggled with misuse or addiction to heroin or other opiates such as prescription painkillers at any point during the last 3 years?
